## Livdelzi

### Products Referenced by this Document

Drugs that are listed in the following table include both brand and generic and all dosage forms and strengths unless otherwise stated. Over-the-counter (OTC) products are not included unless otherwise stated.

Brand Name	Generic Name
Livdelzi	seladelpar

### Indications

The indications below including FDA-approved indications and compendial uses are considered a covered benefit provided that all the approval criteria are met and the member has no exclusions to the prescribed therapy.

#### FDA-approved Indications<sup>1</sup>

Livdelzi is indicated for the treatment of primary biliary cholangitis (PBC) in combination with ursodeoxycholic acid (UDCA) in adults who have had an inadequate response to UDCA, or as monotherapy in patients unable to tolerate UDCA.

This indication is approved under accelerated approval based on a reduction of alkaline phosphatase (ALP). Improvement in survival or prevention of liver decompensation events have not been demonstrated. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

#### Limitations of Use

Use of Livdelzi is not recommended in patients who have or develop decompensated cirrhosis (e.g., ascites, variceal bleeding, hepatic encephalopathy).

All other indications are considered experimental/investigational and not medically necessary.

## Documentation

Submission of the following information is necessary to initiate the prior authorization review:

- Initial requests: Pretreatment serum alkaline phosphatase (ALP) level
- Continuation of therapy: Current serum alkaline phosphatase (ALP) and/or current total bilirubin level

## Exclusions

Coverage will not be provided for members who have or develop decompensated cirrhosis (e.g., ascites, variceal bleeding, hepatic encephalopathy).

## Prescriber Specialties

This medication must be prescribed by or in consultation with a hepatologist or gastroenterologist.

## Coverage Criteria

### Primary Biliary Cholangitis (PBC) (previously known as primary biliary cirrhosis)<sup>1-3</sup>

Authorization of 12 months may be granted for treatment of PBC in adult members when all of the following criteria are met:

- Diagnosis of PBC is confirmed by at least two of the following criteria:
  - Biochemical evidence of cholestasis with elevation of alkaline phosphatase (ALP) level for at least 6 months duration.
  - Presence of antimitochondrial antibodies (AMA) (titer >1:40 by immunofluorescence or immunoenzymatic reactivity) or PBC-specific antinuclear antibodies (ANA) (e.g., anti-gp210, anti-sp100).
  - Histologic evidence of PBC on liver biopsy (e.g., non-suppurative inflammation and destruction of interlobular and septal bile ducts).
- Member has an elevated serum ALP level prior to initiation of therapy with the requested drug.
- Member meets either of the following criteria:
  - Member has had an inadequate response to at least 12 months of prior therapy with ursodeoxycholic acid (UDCA)/ursodiol and the member will continue concomitant therapy with UDCA/ursodiol.
  - Member has an intolerance to UDCA/ursodiol.

Reference number(s)
6598-A

# Continuation of Therapy<sup>1</sup>

Authorization of 12 months may be granted for adult members who have achieved or maintained a clinical benefit from therapy with the requested drug (e.g., at least a 15% reduction in serum ALP level, serum ALP level less than 1.67 times upper limit of normal [ULN], total bilirubin less than or equal to ULN).
